#The PDB database The PDB is the main repository for 3D structure data of biomolecules.

Here we explore it's composition. We obtained most recent stats from http://www.rcsb.org/stats/summary

```
tbl <- read.csv("Data Export Summary.csv", row.names = 1)
```

Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

```
tot.method <- colSums(tbl)
round(tot.method/tot.method["Total"] * 100, digits = 3)
```

```
##            X.ray              NMR               EM Multiple.methods
##           87.197            7.284            5.354            0.106
##          Neutron            Other            Total
##            0.039            0.020          100.000
```

X.Ray is 87.197% and EM is 5.354%

Q2: What proportion of structures in the PDB are protein?

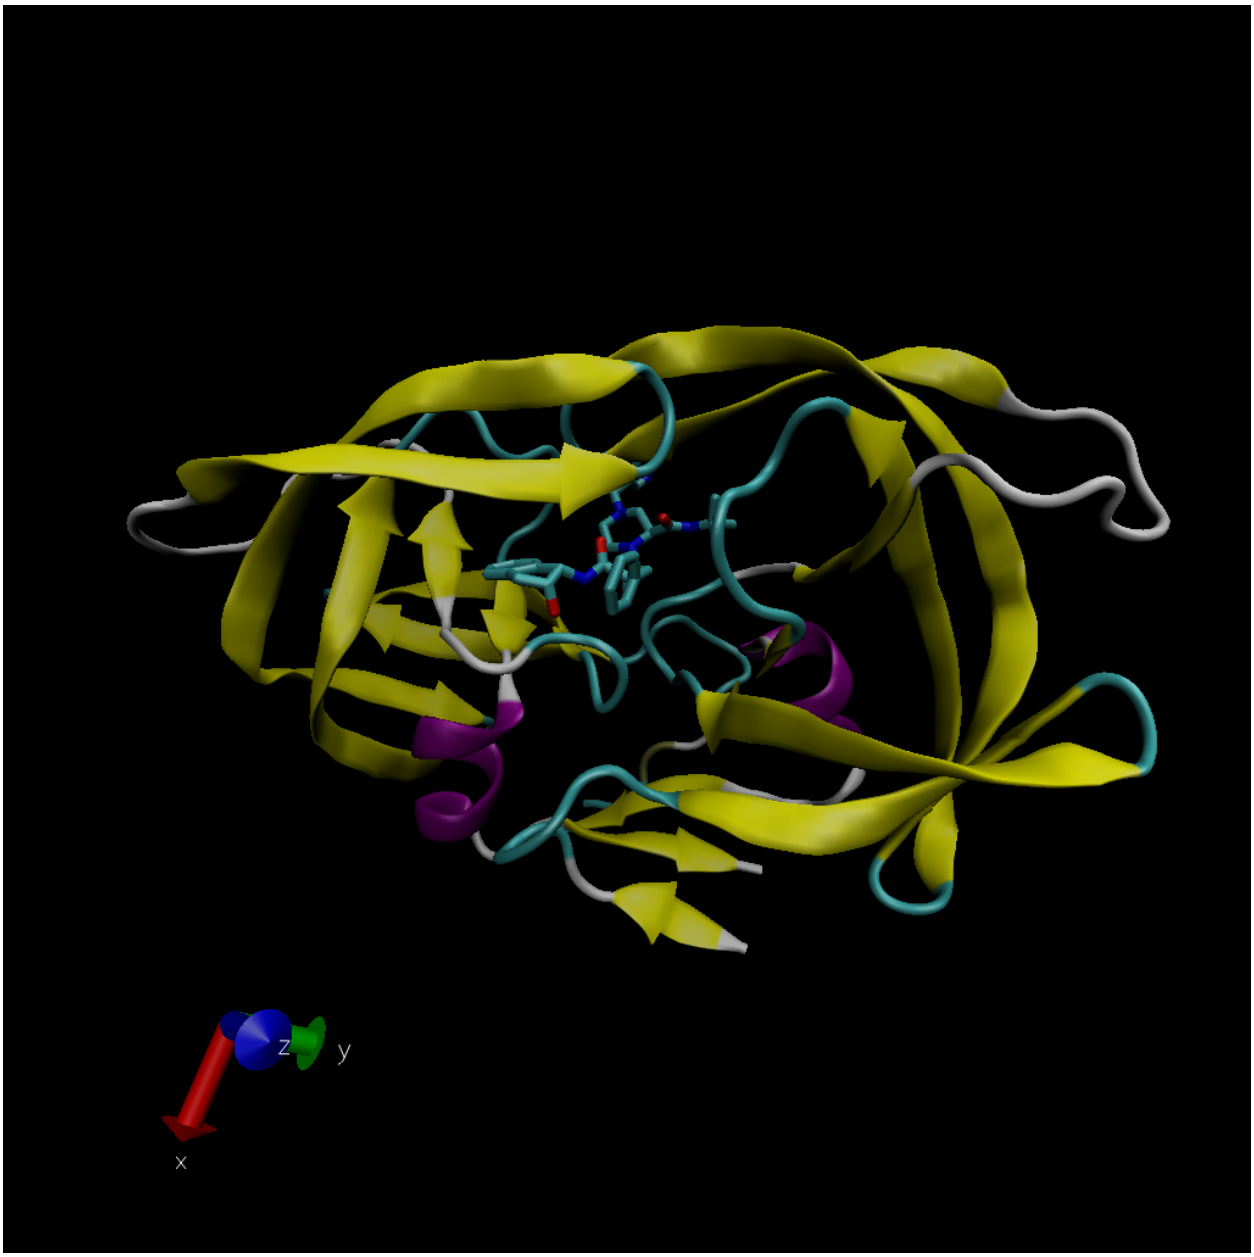
```
ans <- tbl$Total[1]/sum(tbl$Total)*100
round(ans, 3)
```

```
## [1] 87.27
```

The answer to this question is 87.27 % of total structures

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

Here is a VMD generated image of HIV-protease, PBD code: 1hsg



Bio3D package for structural bioinformatics

We will load the bio3d package

```
library(bio3d)

pdb <- read.pdb("1hsg")
```

```
##   Note: Accessing on-line PDB file
```

```
pdb
```

```
##
##  Call:  read.pdb(file = "1hsg")
